It was part of the Windows Essentials software package and offered the ability to create and edit videos as well as post them on OneDrive, Facebook, Vimeo, YouTube and Flickr. The film maker was officially discontinued on January 10, 2017 and replaced by a video editor (formerly Microsoft Story Remix) that is built into Microsoft Photos on Windows 10. History Initial Releases First release of Windows Movie Maker was included with Windows Me on September 14, 2000. Version 1.1 was included in Windows XP a year later and included support for the creation of DV AVI and WMV 8 files. Version 2.0 was released as a free update in November 2002 and added a number of new features. Version 2.1, a minor update, is included in the Windows XP 2 service package. The filmmaker in Windows XP Media Center Edition 2005 had more transitions and support for burning DVDs. Windows Vista The next version of Movie Maker was released as part of Windows Vista and - like most Windows components - reported the 6.0.6000 version number, just like Windows Vista itself. It included new effects and transitions, support for Xbox 360 playback, and support for the DVR-MS file format that Windows Media Centre records. The HD version in premium and Ultimate editions of Windows Vista has also added support for capture with HDV video cameras. The capture master also created DVR-MS files from hdV tapes. However, the Windows Vista version of windows movie maker removed support for importing video from an analog video source such as an analog video camera, VCR or webcam. Because some older systems may not be able to launch a new version of Windows Movie Maker, Microsoft has also released an updated old version of 2.6 for Windows Vista in Microsoft Download Centre. This version included old effects and transitions, and basically the same as Windows Movie Maker 2.1, but without the ability to capture video. The installation requires Windows Vista and is only intended for use on computers where the hardware version cannot be launched. The Windows Movie Maker version was also included in some Vista development (then codenamed Longhorn), but was removed as a result of a development reset in August 2004. After the development rebooted, the interface for the VPF manufacturer Windows Movie Maker was retained in Windows Vista. Windows Live The new version of the software, renamed Windows Live Movie Maker 2009, was released as a beta on September 17, 2008 and officially released as a standalone product through the Windows Live Essentials Suite on August 19, 2009. This is in fact, a brand new app, as it couldn't read projects created by earlier versions, and doesn't support XML custom transitions written for previous versions. In addition, many features have been removed. In addition, the Movie Maker interface has been redesigned in the Windows Live version to use a toolbox tape similar to Office 2007; it also added features such as Auto Movie and the ability to export videos directly to DVDs and YouTube. Some advanced features have also been removed from the software, such as image stabilisation and the ability to record video overs. Movie Maker 2009 supported both Windows Vista and Windows 7. Since the previous version of Windows Movie Maker was no longer included in the operating system, the only way to get a Movie Maker on Windows 7 and later was through a set of Windows Live Essentials, although some vendors pre-installed the app on new PCs. The updated version, Windows Live Movie Maker 2011, was released on August 17, 2010, adding features such as webcam capture, high-definition video support, the ability to upload videos directly to SkyDrive and Facebook, and the ability to add media files stored on network promotions to projects. In 2012, after discontinuing the Windows Live brand (and rebranding Windows Live Suite as Windows Essentials), Windows Movie Maker 2012 was released in April 2012. Support for voiceover recording as well as audio mixer and integration with several free music services has been restored. H.264/MP4 became the default export format (replacing Windows Media Video but can still be used), vimeo download support was introduced (other sites were added to the list in the Windows 8.1 package), and the video's accelerated video stabilisation hardware was also added as an exclusive feature for Windows 8 users. The termination and replacement of Movie Maker was officially removed for download on January 10, 2017. Like the Windows Photo Gallery of Windows Essentials, Windows Maker is now being replaced by the Microsoft Photos app included in Windows 10, which includes a video editor (formerly Windows Story Remix). Layout Layout consists of a storyboard presentation and a timeline presentation, collections for the organization of imported videos, and a preview panel. When you watch Storyboard, the video project is displayed as a film strip showing each scene in the clips. Storyboards/dates consist of one Video bar (with an accompanying Audio bar), one Music/Audio bar and one Titles/Credits bar. In each bar, clips can be added for editing (for example, the WAV Music File will belong to the 'Music/Audio' bar). However, the images can also be imported in time and stretched to any required number of frames. Video and music/audio bars can be cut into any number of short segments, will play together seamlessly, but individual segments are isolated editing wise, so for example, the volume of music can be lowered in just a few seconds until someone is someone By importing footage when you import video into the program, the user can either choose to capture the video (from the camera, scanner or other device) or import it into collections to import existing video files into the user's collection. Adopted formats for imports. WMV/. Asf. MPG (MPEG-1) . AVI (DV-AVI), . Wma. WAV, and. In addition, Windows Vista Home Premium and Ultimate Edition Movie Maker support import MPEG-2 streaming programs and DVR-MS formats. Imports of other container formats, such as MP4/3GP, FLV and MOV, and AAC are also supported if the necessary codecs are installed and the system runs Windows 7 or later. The XP version can import and capture real-time video from an analog source such as a VCR, analog tape-based video camera, or webcam. This feature is based on the purchase of Windows images. Video support in Windows Image Acquisition has been removed from Windows Vista as a result of importing analog frames into Windows Movie Maker is no longer possible. When you import from the DV tape, if you choose Make Clips on Completion, Windows Movie Maker automatically will dream of the beginning of each scene, so the tape appears on the editing screen as a collection of short clips, not one long recording. That is, at each point where the Record button was pressed, a new clip is generated, although the actual hard drive recording is still one continuous file. This feature is also offered after the files are imported already on the hard drive. In the Windows Vista version, the option to make clips upon completion has been removed - clips are now automatically created during the capture process. The effectiveness of the import and editing process depends to a large extent on the amount of fragmentation of the hard drive file. The most reliable results you can get are by adding an extra hard drive designed to scratch space, and regularly reformatting/defragmenting it, rather than just deleting files at the end of the project. Fragmented AVI files result in jerky playback on the editing screen and take much longer to process the final rendering. While it is possible to import digital video from cameras through the USB interface, most older cameras only support USB version 1, and the results are generally poor - sub VHS - quality. The new USB 2.0 cameras produce much better results. The FireWire camera will allow you to record and play images identical in quality to the original recordings if the video is imported and subsequently stored as DV AVI files, although it consumes drive space of approximately 1 gigabyte every five minutes (12GB/hour). In addition, most dv cameras allow the final AVI file to be recorded back on the tape camera to play high quality. Some standalone DVD recorders will also directly accept DVD inputs from video cameras and computers. Editing and Exiting After Any clip can be dragged and dropped anywhere on the timeline. Caught on a timeline, clips clips be duplicated, separated, moved or edited. AutoMovie offers predetermined editing styles (names, effects, and transitions) for fast-track movies. The original camera file on the hard drive does not change; The project file is only a list of instructions for playing the final output video file from the original file. Thus, several different versions of the same video can be simultaneously made from original camera frames. Earlier versions of Windows Movie Maker could only export videos in Windows Media Video or DV AVI formats. It includes some predefined profiles, but users can also create custom profiles. The Windows XP Media Centre Edition is complete with Sonic DVD Burning Engine, licensed by Sonic Solutions, allowing video editors to burn their project in DVD video format on DVD. In Windows Vista, Windows Movie Maker broadcasts a video project for Windows DVD Maker. Windows Movie Maker 2012 introduced the default export in H.264 MP4 format. The video can be exported back to the video camera with the support of the camera. Movie Maker also allows users to post finished videos on video hosting websites. Windows Movie Maker can also be used to edit and publish audio tracks. If you don't have a video or an image, Movie Maker allows you to export audio clips in Windows Media Audio format. The effects and transitions of the Windows Movie Maker supports a wide variety of titles, effects and transitions. Headlines animated text screens are usually posted at the beginning or end of a movie, but can also be posted on video clips. Titles and captions can be added as individual titles or superimpose them on the clip by adding them to the selected clip. Names range from static (not animated) titles to flying, withering, news banner, or spinning newspaper animation. They can also be placed on video clips to create blanks. Transitions affect how one video clip flows into another. Examples include disappearing and dissolving, but many more impressive transitions are available. The effects change the way the video shows up. The example includes resolution control of brightness, contrast or hue, but other, more dramatic effects are available, such as giving the old time a shimmering black and white look. The 2.x versions included in Windows XP include 60 conversions, 37 effects, 34 titles and 9 animation credits. The Windows Vista version includes a different set of transitions, effects, and title/credit animations, while resetting a few of the old ones. There are in all 49 effects and 63 conversions. They are used using the drag and drop interface from effects folders or transitions. Early versions (V2 further) of Windows Movie Maker had a flexible interface, so programming user effects and other content was possible through XML. Windows version direct3D-based effects. Microsoft also provides SDK documentation for user effects and transitions. Because the effects are based on XML, users can create and add custom effects and transitions of their own XML knowledge. Many custom transitions were commercially available and created additional features such as picture in picture. Windows Movie Maker V6 doesn't support effects and transition settings the same way V2.x does and so many settings have to be rewritten. Versions after V6 do not support user transitions and effects at all. The reception and criticism of Movie Maker 1.0, presented with Windows Me, was widely criticized for being naked bones and suffering from a sad lack of features; and saving movies only in Microsoft's ASF file format. The critical reception of versions 2.0 and 2.6 was a little more positive. Many longtime users have been frustrated by the removal of so many features in the effective rewrite software in Live Movie Maker 2009. Some of these features (such as sound level visualization) were subsequently re-added. In June 2008, a memo purportedly published by Bill Gates in January 2003 was circulated on the Internet in which he strongly criticized the process of downloading the film The Creator of the Film. The memo was originally available online as part of the plaintiffs' evidence in Comes v. Microsoft Corp., an antitrust class lawsuit, and was presented as evidence in the case on January 16, 2007. The fake version of Windows Movie Maker's termination has led to scammers abusing their name. In late 2016, a few months before the termination of the Windows Essentials Suite (including Movie Maker), a website called windows-movie-maker.org (no longer available) that offered a tampered version of Windows Movie Maker, appeared as one of the best results when searching for Movie Maker and Windows Movie Maker on Google and Bing, a scam only widely recognized as such in 2017. It was identical to the real creator of Windows Movie Maker, however, unlike Microsoft's official and free Windows Movie Maker, it would not allow users to save videos without buying. After installing and executing the program, the user was greeted with a dialog box explaining that it was a trial and a purchase was needed. ESET also discovered a malware called Win32/Hoax.MovieMaker in the aforementioned version. The fake will also limit the installation of the WLE (Windows Live Essentials) Movie Maker by changing the Windows registry. Links to b Get Movie Maker - Microsoft Windows.
